ConstraintLayout Practice

Programming Task: Create an application layout using **ConstraintLayout** so that every UI element scales proportionally on different devices. The final design should match the structure of the given image.

You are recreating a layout that features:

- A top image (scaled 16:9)
- A centered, bolded title
- A center, italicized subtitle
- Two stacked buttons (“ACCEPT” and “DECLINE”)

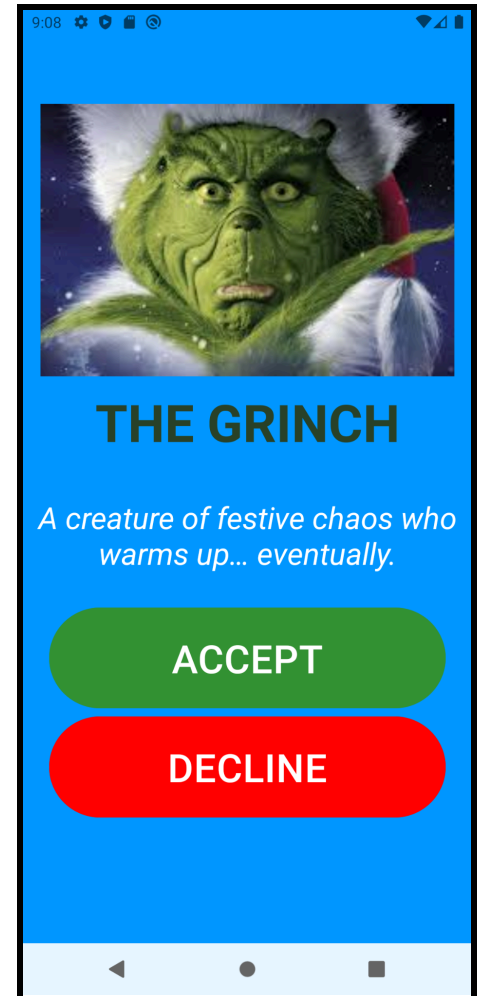

Your final layout must look visually similar on phones and tablets.

To ensure your layout scales consistently across all screen sizes, each view must take up a predictable percentage of the screen height. Use

app:layout_constraintHeight_percent to achieve this.

Your layout must follow these proportions:

- Top ImageView: ~30% of the screen height
- Title TextView: ~10% of the screen height
- Subtitle TextView: ~15% of the screen height
- ACCEPT Button: ~12% of the screen height
- DECLINE Button: ~12% of the screen height
- The remaining space may be small margins created by ConstraintLayout automatically.

Check your layout on at least two different emulator sizes to confirm everything scales correctly.

If you are unsure of how to do something, do some research! Use the Android Documentation, Google, or AI to assist you.
