

## Introduction to Threads Practice

---

We will write some programs that require threading; otherwise, they will not compile. The following two lessons will cover basic multi-threading and a new object type that we will use.

1. Write a program that reads a text file containing integers and computes their sum. Your program must create a thread to read the information from the text file, and when it is complete, the main thread will find the sum.
2. Write a program that will create two threads. The first thread will write the numbers 1-100 in one text file, and the second thread will write all of the lowercase letters of the alphabet in a different file. ***You must research and determine how to write data into a text file.***
