Spinners Practice

Create an app that will add names to an address book. The address book will simply be another spinner in this app.

Part 1:

The user selects a prefix from a **Spinner** and then types a name into the **EditText**. When the user is done, they click the “ADD” button, and the prefix and name are displayed in a TextView. You may need to research how to grab the text from the selected item in the spinner.

Part 2:

The text from the TextView will be added to the Spinner at the bottom of the page. You will need to do some exploration to accomplish this. You will also need to make sure that you update the information in the adapter in the second spinner.

For this assignment, refer to the information on [Android Developers](#), but feel free to use Google to search for any information you need.
