Try-Catch & StringTokenizer Practice

Try-Catch Practice

Create two examples of exceptions and handle them appropriately in your program. The examples you create should be errors we have encountered in class. You must use at least one example that involves converting a String input into a number value ("one" -> 1). [NumberFormatException or InputMismatchException]

StringTokenizer Practice

Part 1 [TextPad]: Use the StringTokenizer to complete the following:

1. Count the number of punctuation marks in a sentence
2. Count the number of sentences in a given string
3. Count the number of words in a given sentence
4. Find the average number of words per sentence in a String (there should be more than one sentence)
5. Determine how many words have more than one vowel in a given sentence.

Part 2 [Android Studio]: Get the tasks above to work in Android Studio. The example String should be displayed in a TextView, and each answer should be shown in its own TextView. Use any Layout of your choice.
