Widgets (SwitchEditTextSeekBar) Practice

Practice 1: Create an app that meets the following criteria:

	A Switch at the top should enable and disable the SeekBar at the bottom. The SeekBar should be turned off when the switch is in the off position. You should be able to type in a color in the text field. If the color is red, blue, or green, the “Display Color” text will be changed to the appropriate color. If possible, try to ignore the casing on the input string. The color should return to black when an invalid color is displayed. Adjusting the SeekBar at the bottom will change the width of the Button above it. If you need help with something, try working with a partner and/or conducting some research using your notes or ChatGPT/Google. Remember, we only ask AI for assistance and pointers, not answers!
---	--

Practice 2: Create an Android app called **Profile Customizer** that allows users to personalize a simple on-screen profile using three types of widgets: a **Switch**, an **EditText**, and a **SeekBar**. Your app should include:

1. An **EditText** where the user can type their name.
2. A **TextView** that displays the name the user enters.
3. A **SeekBar** that changes the size of the displayed name.
4. A **Switch** that toggles between **Light Mode** and **Dark Mode** (changes the background and text colors).

The interface should update immediately when the user interacts with any of the widgets. You are encouraged to design the layout neatly, choose readable colors, and make the app feel polished and responsive.

Finished Early Extension Ideas:

- Add a **Reset** button that restores light mode, default text size (20sp), and clears the name.
- Display a **Toast** when the user switches modes (e.g., “Dark Mode Enabled”).
- Add a second **SeekBar** to adjust text color intensity.
